Neurons are the functional units of nervous tissue. Each neuron responds to, transmits, and communicates stimuli by releasing various neurotransmitters via neuronal synapses. Maintaining the shape and structure of neurons is critical for neurons to function well. This is achieved by cytoskeletal elements called microtubules.

It results in the production and build-up of thick mucus.

Mucus is a fluid, which is normally thin and sticky in consistency. It protects the epithelial lining of several organs and systems in the body.

In the respiratory tract, goblet cells produce the mucus. Its stickiness functions to trap bacteria and debris in the airways.

It is also thin in consistency, allowing the mucus to be easily swept out of the lungs via the movement of hair-like projectors that line the airways, known as cilia.

This process is called mucociliary clearance.
